What would be our project idea if we had to make a video game/interactive experience about culture and heritage that uses a map API & geolocalization

Historyscape

- A puzzle game IRL (or VR) like an escape room
- The goal would be to solve the mystery with clues left in different monument locations
- The mysteries should be based off a real story or a legend recorded in the country's history

- If made for IRL games, it would make use of geolocalization to propose you games (perhaps with other people) around you or give you clues of where to look or what to look for or similar for your on-going game.

- If made for VR games, it would make use of a map API to automaticly transport you to your desired location, would still allow almost physical interaction with objects.

What would be our project idea if we had to make an IOT item that depends on weather and supports modding ?

TinyWeather™

- A tiny portable weather station that in it's most simple form would tell you the basics that people are interested in about the weather like the current temperature, the current humidity etc...

- It would support mods/add-ons that would enhance it's capabilities, like one mod would be adding a chip that fetches information from an API to tell you the forecast, at what time would the sunset happen etc...

- Other mods would allow it to connect to other TinyWeather™ stations to share data about the weather, and if a large enough area it could be used to predict it's own forecast instead of using an API, it could be used for studies about the local weather of an area etc...

- A cheaper alternative to know more about the weather than making a new official weather station which often gate-keep their data.

What would be our project idea if we had to make a project using visual, audio and signals for sustainable developement

Fauna Keeper

- Learn how animals communicate, be it visually, audibly or by inaudible and invisible waves (like bats)
- To help study animal around highway crossings
- Study how human society affects neighboring undeveloped territories
- Keep track of the well-being of animals in parks and reserves and zoos
