My Epitech Inovationn project

Super coll descriuption

PROJECT 1 : GameSphere

- Description : An application for creating addictive games on Android and iOS. The particularity of our application is to help implement mechanisms to accelerate downloads and quickly reach over a million, which then offers numerous opportunities to creators. For example, our demo game, a tamagotchi-like, has been downloaded over 1,400,000 times on the Google Play Store.

Track 1 : Tech

Create addictive games on windows, linux & mac quickly.

Support for multiple media types (.wav or .ogg, .obj or .blend)

Framework (game elements like player controller, buttons, etc) allowing quick developpement and beta versionning.

Track 2 : Entrepreneurship

Quick deployement to steam and play store

Premium tier subscription to access game templates (prebuilt games -> idle, roguelike, arcade)

Bank of assets + assets store

PROJECT 2 : TrackPulse

- Description : An application for collaborative railway information. It allows users to stay informed in real-time about the status of their train line or station. The user can search for their train or station and access all the information provided by SNCF and the rest of the community. This application allows users to submit a range of information related to user comfort: heating/air conditioning issues, ticket vending machine malfunctions, etc. Users can also report information, vote on those submitted by their peers to ensure accuracy, add trains to favorites, and much more!

Track 1 : Solution

Real time train tracking through gps or other solutions provided by sncf or other services

Real time train motor evaluation to ping mechanics if problem with trains

Track 2 : Entrepreneurship

Buying tickets,

Reselling tickets

Bulk buying tickets through different services based on planned routes

PROJECT 3 : Breath Link

- Description : A solution designed for individuals suffering from cystic fibrosis. It combines connected devices, web and mobile applications, and coordination with medical personnel to offer personalized and tailored monitoring for this chronic condition. The patient regularly measures their respiratory parameters using a connected spirometer, without needing to visit a healthcare center. An alert threshold can be set with their physician, who is directly notified in case of exceeding it, enabling prompt initiation of treatment without delay

Track 1 : Tech

Manage connected devices through a single app using open source software to keep it maintainable

Track 2 : Solution

Plan out appointments based on collected data -> link it with calendar

Emergency QRcode to relay important data to first emergency responders
